

Green. Building. Solutions.

Sahana Doravari Centre For Architecture, Mysuru Indian

// GBS was very well conducted, and the organisers were considerate of participants from different time zones.

I liked that we had many guest lecturers from different fields.

I've learnt a lot about construction in cool climates and ways to build sustainably.

I also realised the role of an architect as a co-ordinator and leader in sustainable design, because we worked in multi-disciplinary teams in the summer school.

I also learnt about the different aspects of sustainable design, such as urban planning,

climate and zero energy construction, as well as the software used to optimise energy use in buildings.

I would recommend this course to anyone interested in sustainable design.

It gives a lot of exposure to the latest technologies and techniques and is closely linked with the European Union sustainability goals.

I think Green.Building.Solutions. is a valuable investment towards my future as a green architect.
